1 Introduction

DOSA Consulting Engineers were engaged as Consulting Engineers for the proposed development at Old Whitechurch Road, Kilnap, Cork.

DOSA Consulting Engineers carried out a number of site investigations and their findings have been incorporated to deal with solutions to:

- Surface Water Drainage Network
- Foul Drainage Network
- Water Supply

The proposals for the foul sewer & water infrastructure associated with this development were discussed with Mr. Michael Galvin Senior Design Engineer, Southern Region, Irish Water and Mr. James King, Design Engineer, Southern Region, Irish Water.

1.1 Site Description

The Council is the owner of the site at Kilnap off the Old Whitechurch Road (OWR). It comprises of some 22 hectares (54 acres) of a southerly sloping site zoned residential in the Cork City Development Plan located in the North of the City ("Development Site"). The Development Site is ideally located at the north-western gateway to the City near the proposed North Ring Road. It is located within a reasonable cycling and walking distance of the Blackpool Retail and Business Park while at the same time bounding the Glenamought Valley. The Development Site should create a sustainable residential neighbourhood, which would derive character from its location, topography, amenity, urban design quality and would be a most attractive place to live at the Northern gateway to the City.

Pre-enabling works have been carried out by the Council and the site has been fully serviced from an infrastructural aspect.

The site currently has the following infrastructure in place

- Access
- Foul Connection Infrastructure
- Stormwater Connection Infrastructure
- Water Connection Infrastructure
- Utility Infrastructure

A snapshot of the overall council landholding is outlined in Figure 2.1 below.

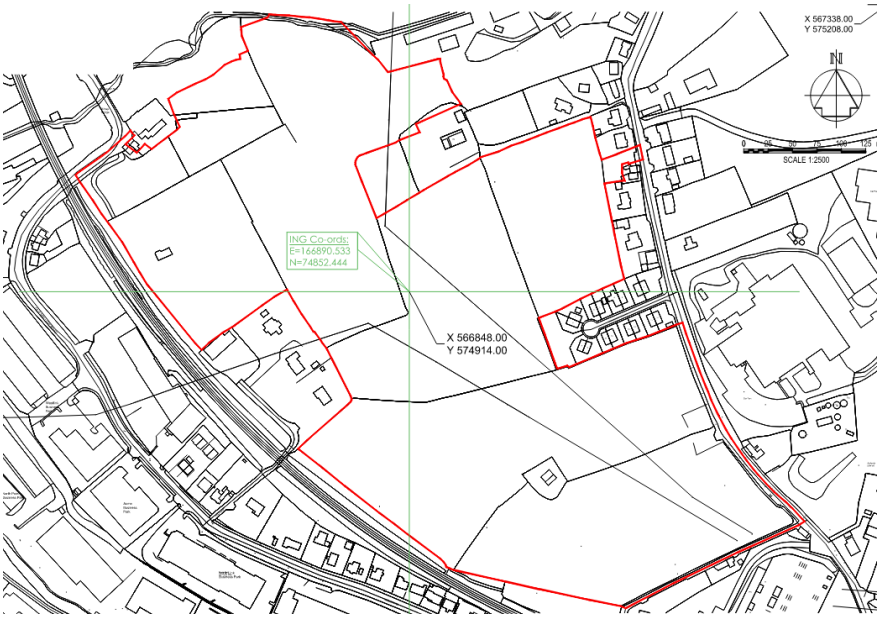

Figure 2.1 – Context Map

1.2 Development Description

Phase one of the development is 3.7 ha, with a developable area of 2.74 ha. It is situated approximately 3.5 km north of Cork City Centre, in an area characterised by commercial and residential use. It is located off the N20 and a new road that meanders through the site to connect Old Mallow Road in the north with Old Whitechurch Road in the Southeast.

The proposed development will consist of 1 no. accessible 4 bed detached, 72 no. 3 bed semi-detached, 8 no. 3 be townhouses, 6 no. 2 bed townhouses, 4 no. 3 bd duplex apartments & 4 no. 1 bed apartments. The form, architecture and scale of the development is consistent with the immediate context and it will enhance the visual amenity of the site as a whole.

1.3 Site Topography

The topography of the site slopes from the southwest in a north and easterly direction as per the contouring below.

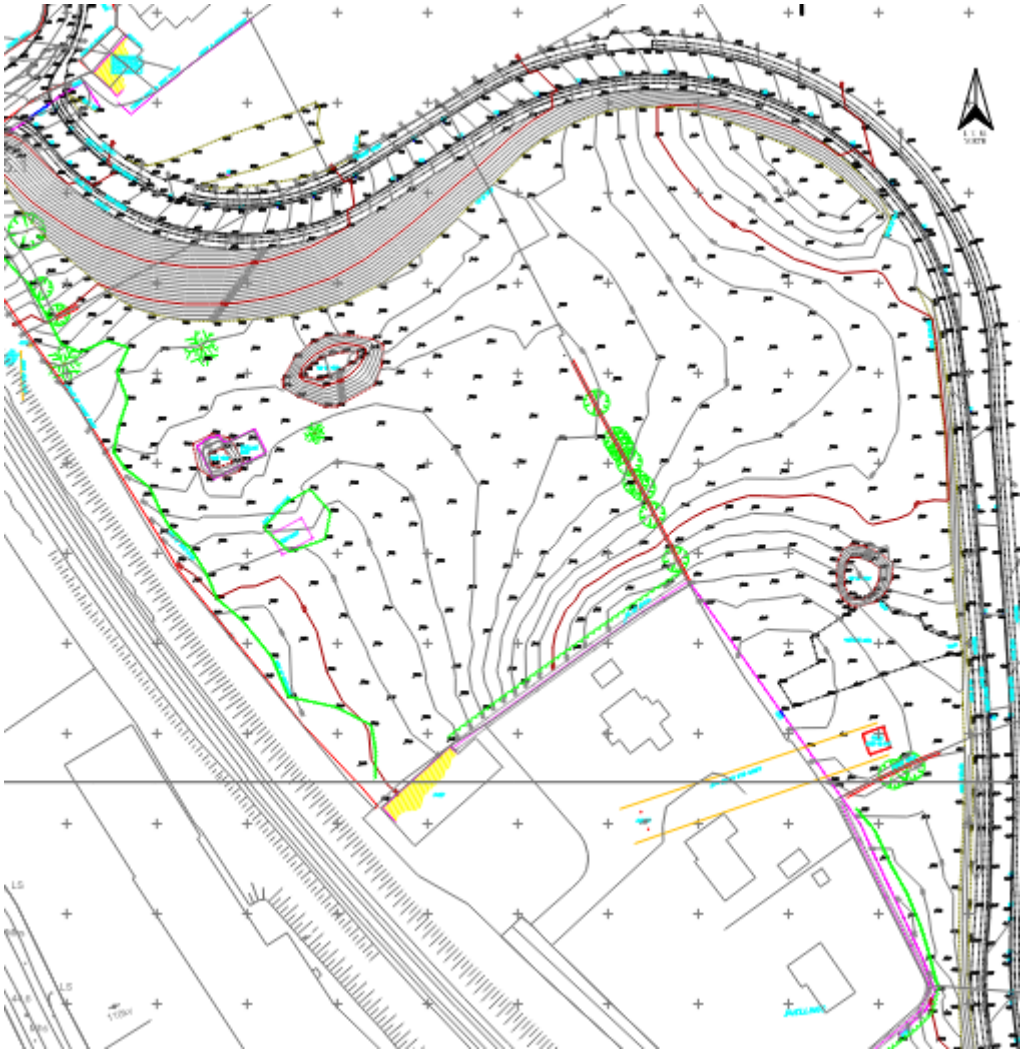

Figure 1.3 – Site Topography

2 *Surface Water Design Overview*

The completed development site is a mix of soft landscaping and hard paving or roofing. The existing topography is a single catchment. Groundwater flow direction is interpreted to be to the north / northeast, providing baseflow to the Glennamought River (which is directly north of the site.)

The runoff from the entire developed site will however discharge to the Glennamought River. . The increased runoff flows will be attenuated to greenfield runoff rates prior to discharging to watercourse.

Discharge from Phase 1 will be into the existing stormwater network and attenuation infrastructure provided by Cork City Council as part of an enabling works package.

The proposed storm water drainage system has been designed to cater for all surface water runoff from all hard surfaces within the proposed development including roadways, roofs, parking areas and green areas etc. The development has been split into a number of catchment areas. The only areas excluded from the catchment areas is the green areas downstream of the development.

The proposed surface water drainage network will collect surface water runoff from the site via a piped network prior to discharging off site via the attenuation tanks, flow control devices and separator arrangement. Final discharge rates will be at Qbar greenfield run-off rates.

Prior to entering the system, the stormwater generated will be treated through a number of nature-based solutions in line with adopted SuDS measures.

The storm sewer network was designed using Innovyze Micro Drainage modelling software. Outputs from the storm sewer design can be found in the Appendices of the Infrastructure Report.

Refer to DOSA Drawings for details of the proposed surface water network.

All flow velocities within the network fall within the limits of 0.75 and 3m/sec as set out in "Recommendations for Site Development Works" as published by the Department of Environment. The storm water network and infiltration basin are designed to accommodate the 100-year return period plus an additional 20% to account for the effects of climate change. Prior to submitting the Services Report we consulted with Cork City Council in relation to the existing drainage services in the area of the proposed development. The existing development contains an existing stormwater network along the spine road and the attenuation for the proposed site has already been accounted for within this network.

2.1 Surface Water Drainage Network

2.1.1 Existing Infrastructure

Pre-enabling works have been carried out by the Council and the site has been fully serviced from an infrastructural aspect.

The site currently has the following infrastructure in place

- Stormwater Connection Infrastructure

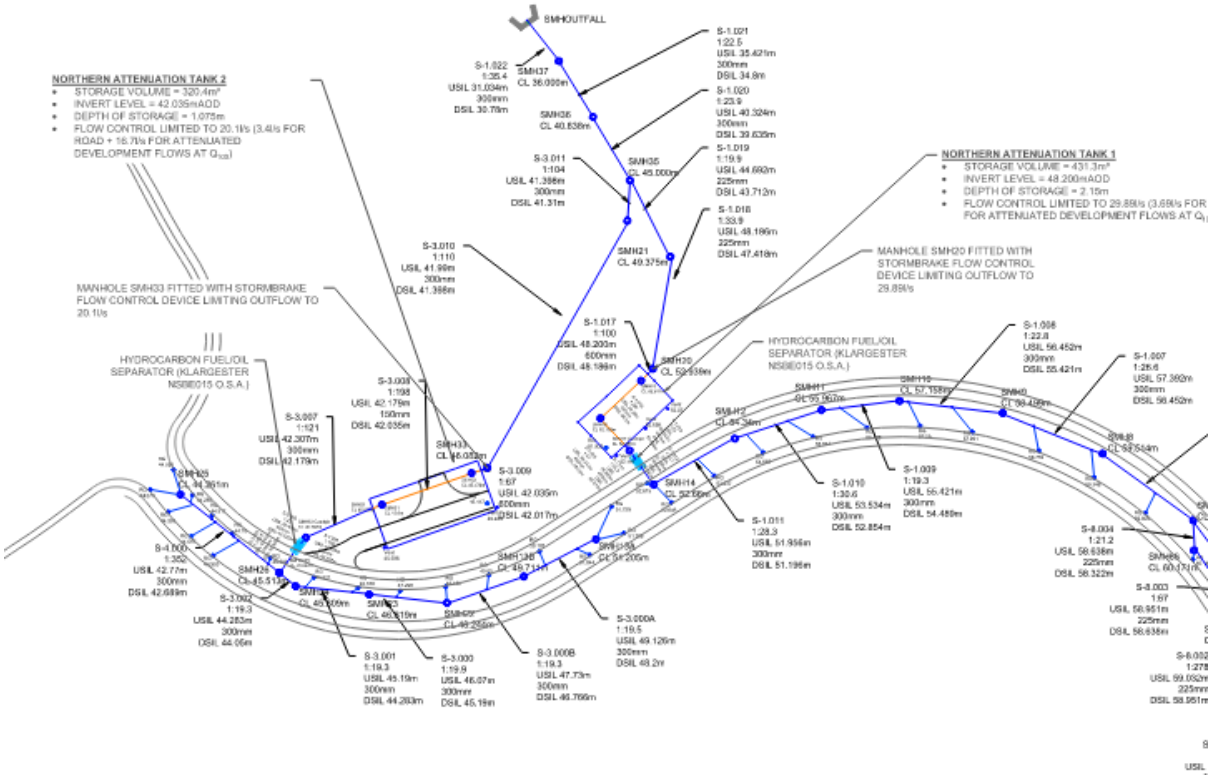

Figure 2.1 – Existing Stormwater Infrastructure

Figure 2.2– Existing Attenuation Tank Locations

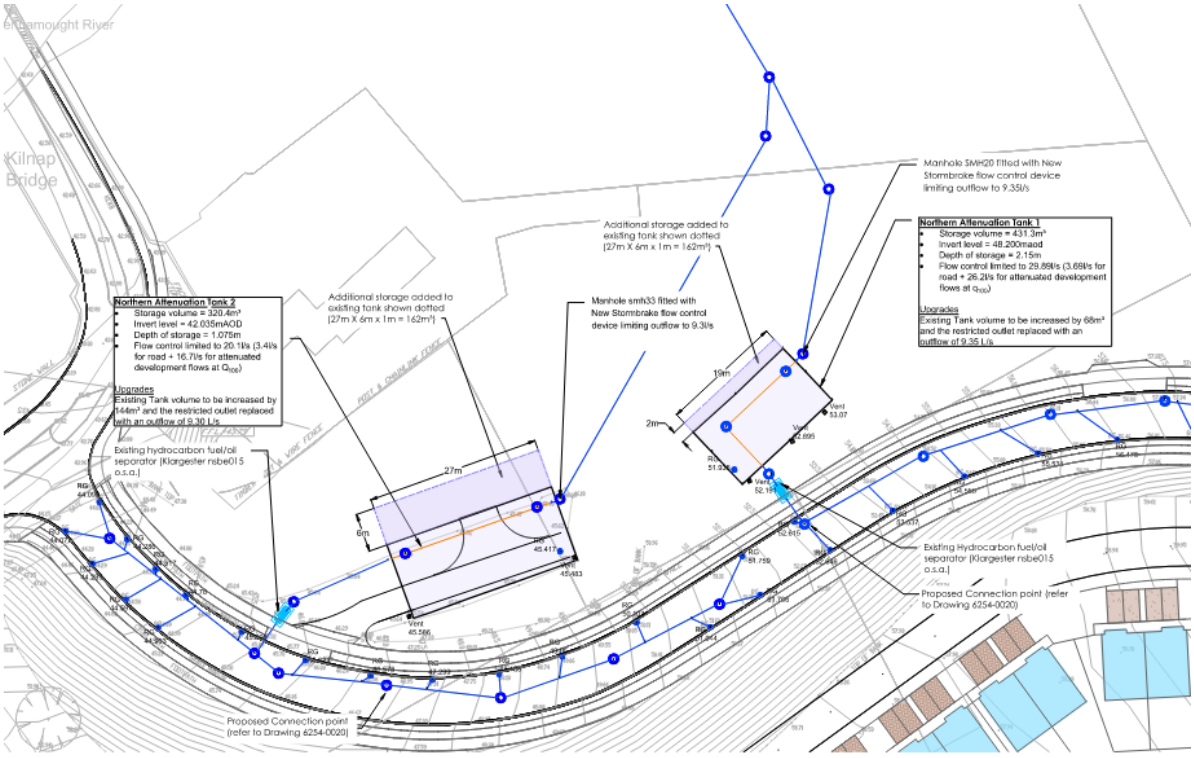

Figure 2.3–Proposed Tank Upgrades

Petrol interceptors have been provided upstream of the attenuation tanks to ensure that any remaining hydro-carbons or pollutants within the runoff from trafficked areas are treated prior to outfall to the existing watercourse. The existing Interceptors are summarised below

		Petrol Interceptor Specification
Catchment 1	Tank No. 1	Klargester NSBE015 O.S.A
Catchment 2	Tank No. 2	Klargester NSBE015 O.S.A

Table 2.0 – Interceptor Details

The attenuation volume provided by Cork City Council as part of the enabling works would appear to be less than that required to cater for a 1 in 100-year return period. The current design indicates a revised Qbar and attenuation volume. As a result, it is proposed to increase the storage volumes of the existing tanks and replace the restricted outlets to cater for the revised design.

	Attenuation Volume Provided (Enabling Works)	Allowance for Road (Enabling Works)	Volume dedicated to Development (Enabling Works)
Tank 1	431.3 m^3	54.3 m^3	377 m^3
Tank 2	320.4 m^3	54.4m^3	266 m^3

Table 2.1 – Summary of Existing Attenuation Tanks

	Volume dedicated to Development (Enabling Works)	Revised Attenuation Required for Proposed Development	Additional Attenuation Required for Proposed Development
Tank 1	377 m^3	445 m^3	68 m^3
Tank 2	266 m^3	410 m^3	144 m^3

Table 2.2 – Summary of Additional Attenuation Volumes

The existing tanks are provided a hydro brake at the outfall of the surface water catchment to restrict the outflow of water from the subject site

		Restricted Outlet Development (Enabling Works)	Restricted Outlet Road (Enabling Works)	Total (Enabling Works)
Catchment 1	Tank 1	26.2 l/s	3.69 l/s	29.89 l/s
Catchment 2	Tank 2	16.7 l/s	3.4 l/s	20.10 l/s

Table 2.3 – Summary of Existing Restricted Outlets

		Restricted Outlet Development (Proposed Works)	Restricted Outlet Road (Enabling Works)	Revised Total
Catchment 1	Tank 1	5.66 l/s	3.69 l/s	9.35 l/s
Catchment 2	Tank 2	5.90 l/s	3.4 l/s	9.30 l/s

Table 2.4 – Summary of revised Restricted Outlets

As-built drawings of the Existing Stormwater Infrastructure and proposed upgrades are attached in Appendix H. The revised Qbar calculations are in Appendix K.

2.1.2 Proposed Stormwater Infrastructure

The surface water drainage network for the proposed development was modelled using the Microdrainage software application. The surface water pipe lengths, slopes, contributing impermeable areas, upstream invert levels, upstream cover levels and pipe diameters were entered into the model using the drawings supplied.

The global variables required for the model were the M5-60 and Rainfall Ratio. These two factors may be read from maps contained in the Wallingford procedure. They enable the program to calculate the intensity, duration and frequency characteristics of storms.

M5-60 is the rainfall depth based on a 60-minute storm of 5 years return period. Ratio R is the ratio of the 60-minute storm to the 2-day storm for the 5-year return period events. These values are as follows:

- M5-60 = 18.80mm
- Ratio R = 0.250

Microdrainage generates design storms using the principles set out in the Flood Studies Report (NERC 1975).

Both a summer and winter rainfall profile was used for the design of the pipework. A summer profile gives higher rainfall intensities and results in higher runoff rates and is used to determine the required capacity of the pipework.

The surface water drainage network was assessed for compliance with maximum and minimum velocities, pipe length etc. The network was designed to ensure velocities in the network and pipe gradients did not exceed the maximum velocity of 4.0m/s. The minimum velocity allowed was 0.75m/s.

The design of the drainage network was assessed using events with a range of different durations to determine the critical event for each return period analysed as follows:

- 1 in 2-year return period events were used to ensure that the system did not surcharge;
- 1 in 100-year return period events were used to ensure that flooding did not occur.

2.2 Design Criteria:

The proposed surface water drains have been designed in accordance with the Greater Dublin Strategic Drainage Study (GDSDS), the Department of the Environment's Recommendations for Site Development Works for Housing Areas, the Department of the Environment's Building Regulations "Technical Guidance Document Part H Drainage and Waste Water Disposal" and BS EN 752: 2008 Drain and Sewer Systems Outside Buildings.

- Catchment Area 1 1.769 Ha
- Catchment Area 2 1.839 Ha
- Return period for pipe work design 2 years
- Return period for attenuation design 100 years
- Soil Type 2
- Allowable Outflow (Catchment 1) 26.2 l/
- Allowable Outflow (Catchment 2) 16.7 l/
- Time of entry 5 minutes
- M5 – 60 18.80 mm
- Ratio "r" 0.250
- Pipe Friction (Ks) 0.6 mm
- Minimum Velocity (based on pipe flowing full) 1.0 m/s
- Rainfall Runoff from Roads and Footpaths 100%
- Rainfall Runoff from Roofs 80%
- Rainfall Runoff from Driveways 80%
- Rainfall Runoff from Green Areas 20%
- Rainfall Depth Factored for Climate Change (as per GDSDS) 20%

(in accordance with GDSDS Volume 2, Chapter 6, Table 6.2 – see below)

Climate Change Category	Characteristics
River flows	20% increase in flows for all return periods up to 100 years
Sea level	400+mm rise (see Climate Change policy document for sea levels as a function of return period)
Rainfall	10% increase in depth (factor all intensities by 1.1)
	Modify time series rainfall in accordance with the GDSDS climate change policy document

Table 6.2 Climate Change Factors to be Applied to Drainage Design

2.3 Catchments

The development has been divided into 2 Catchments as indicated in Fig 2.3 Below

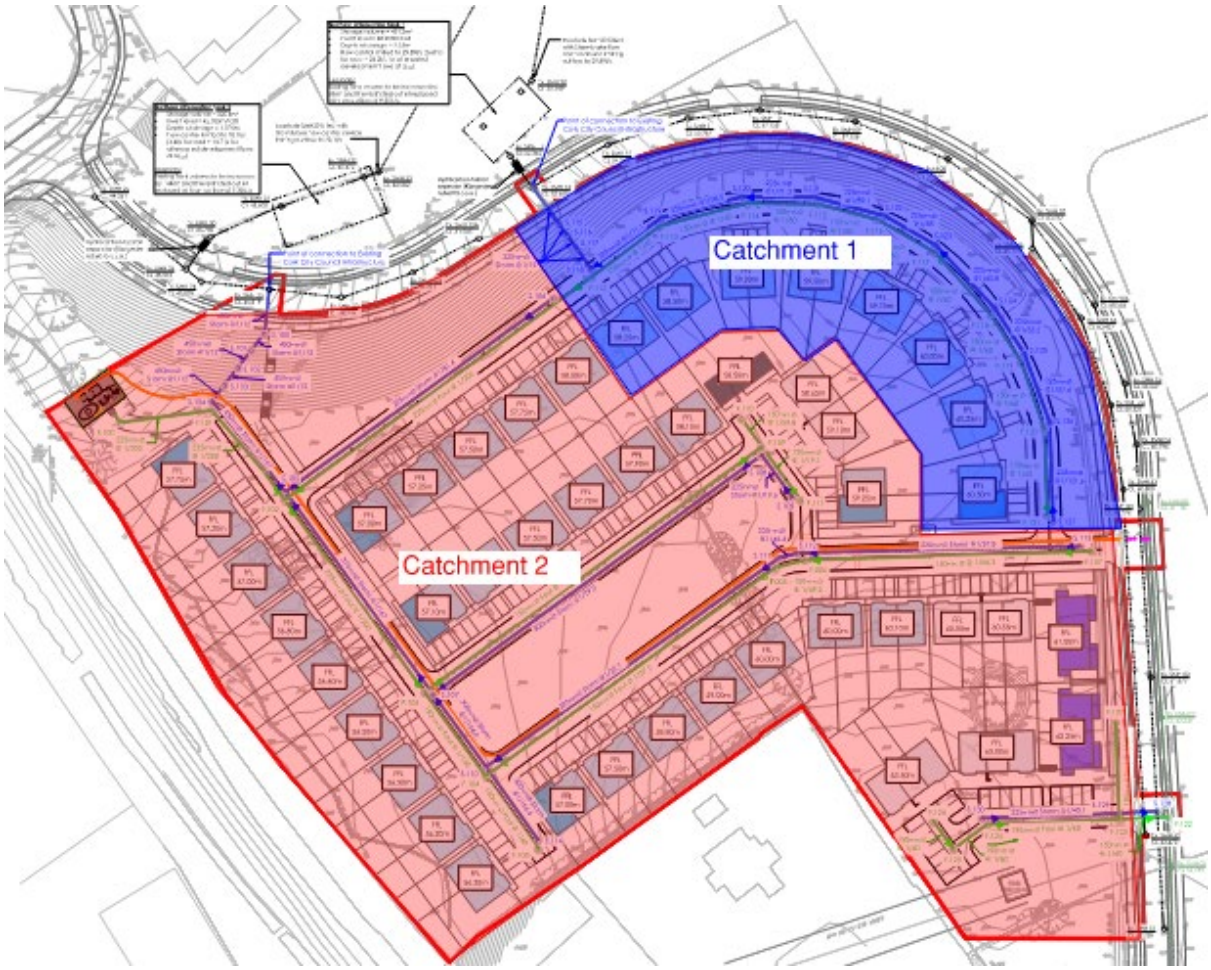

Figure 2.3– Catchment Plan

3 *Foul Sewer System*

3.1.1 Existing Infrastructure

Pre-enabling works have been carried out by the Council and the site has been fully serviced from an infrastructural aspect.

The site currently has the following infrastructure in place

- Foul Connection Infrastructure

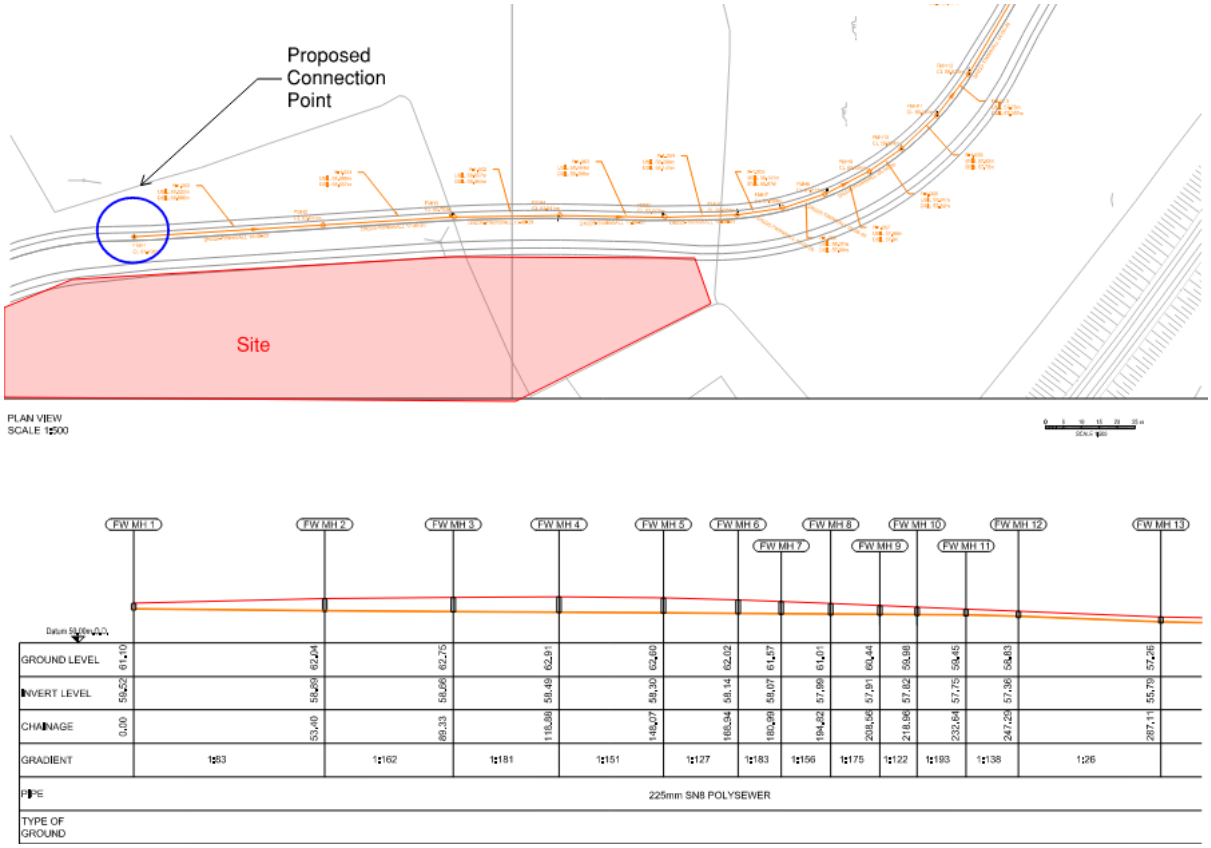

Figure 3.1 – Existing Foul Infrastructure

3.2 Foul Sewer Design

A Pre-Connection Enquiry was submitted to Irish Water. The Irish Water Reference Number for this enquiry is CDS22007050. The response to this Enquiry was issued by Irish Water on 11th November 2022. This confirmed that, subject to a valid connection agreement being put in place, the proposed connection to the Irish Water network could be facilitated. The Confirmation of Feasibility document is included in Appendix A.

The foul sewer has been designed using the System 1 and Simulation Modules of the Micro-drainage package. The foul network design addresses present day design issues and can view velocities at Full Bore, Proportional Depth and 1/3 flow.

A model of the proposed foul drainage network was built using the micro-drainage software applications. The model was analysed and amended until the results met with the design criteria specified.

The network has been designed to achieve self-cleansing velocities at 1/3 flow whilst maintaining minimum gradients.

3.2.1 Development Breakdown

95 No. Residential Units

Section 3.6 of The Irish Water Code of Practice Wastewater Infrastructure states that for the gravity sewers shall be designed to carry a minimum wastewater volume of 6 times the dry weather flow (6DWF) which is to be taken as 446 litres per dwelling

Loading = (95) (446) / (24) (60) (60) = 0.490 litres/second

6DWF = 2.94 litres/second

The layout of the proposed foul sewer network is shown on the Proposed Stormwater & Foul Sewer Layout Plan 6254-0020.

The overall quantity of wastewater for the proposed development is estimated at42.34m³ per day.

The foul waste within the development will be collected via an internal gravity network and will discharge to the existing public foul sewer.

All works will be in accordance with Irish Water specifications and requirements.

All works will be in accordance with Irish Water Code of Practice for Wastewater Supply & the Wastewater Infrastructure Standard Details Document Number: IW-CDS-5030-01.

3.3 Pump Chamber Design

3.3.1 Pump Chamber Breakdown

Based on the development breakdown, 86 no. dwelling houses will discharge to the pumping station.

Dry weather flows (DWF) is taken as 446 litres per dwelling as per the Irish Water Code of Practice for Wastewater Infrastructure

Proposed Storage = 24 hours

Storage Capacity required = (446) (86) = 38,356 litres or 39.36m³

It is proposed to provide a pumping chamber with a storage capacity of 40.0m³ and pump the effluent generated via an 100mm diameter HDPE rising main and connect to the gravity sewer on the main road as shown on the Proposed Drainage Layout Drawing 6254-0020.

4 *Water Supply*

4.1.1 Existing Infrastructure

Pre-enabling works have been carried out by the Council and the site has been fully serviced from an infrastructural aspect.

The site currently has the following infrastructure in place

- Water Connection Infrastructure

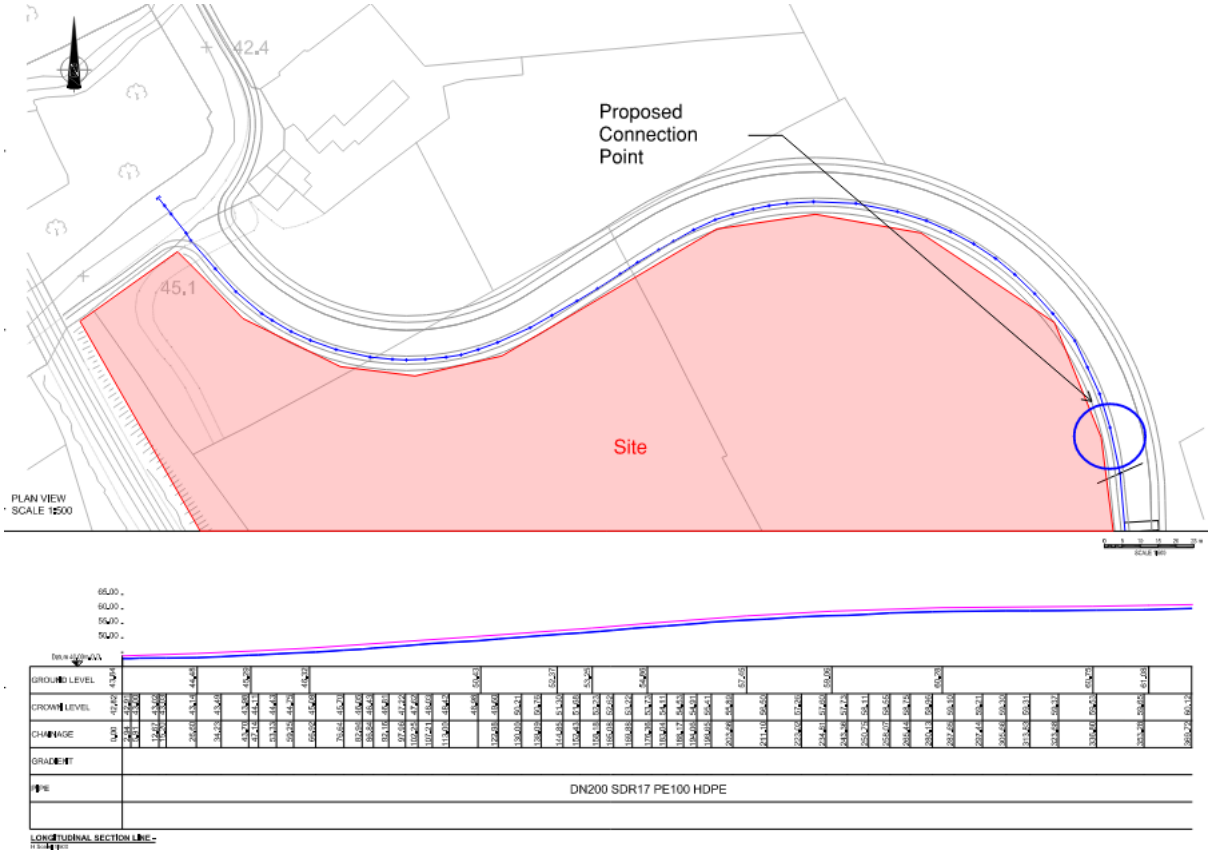

Figure 4.1 – Existing Watermain Infrastructure

As with the drainage network, a Pre-Connection Enquiry was submitted to Irish Water under Reference No. CDS22002703. This confirmed that, subject to a valid connection agreement being put in place, the proposed connection to the Irish Water network could be facilitated.

It is proposed to provide a new 100mm I.D. Ø (inside diameter) HDPE connection to the public watermain with associated valves and metering requirements. Internally within the development it is proposed to have a series of 100mm I.D. branches and loops with associated hydrants, valves and metering requirements.

Water distribution supply to each building will be sized to cater for the requirements of those particular uses. Metered connections will be made to the main in accordance with Irish Water specifications and details.

The layout of the proposed watermain network is shown on the Proposed Watermain Layout Plan 6254-0030.

All works will be in accordance with Irish Water Code of Practice for Water Supply & the Water Infrastructure Standard Details Document Number: IW-CDS-5020-01.

Details of the proposed Pump Station have been included in Appendix J

5 Summary of Results

The storm water network was built and analysed using the Microdrainage Software application and were assessed for a 1 in 2 year storm & 1 in 100 year storm. A summary of the results is shown in Tables 5.1 below

The global variables, pipeline and manhole schedules for modelled and these show the basic pipe details such as pipe length, diameter, roughness coefficient, upstream invert, velocity, etc.

Table 5.1 Summary of Surcharge and Flooding

Storm Event	Results
1 in 2 year	No surcharge of the stormwater network
1 in 100 year	Surcharge

The stormwater system is designed to ensure no surcharge occurs during a 1 in 2-year return period event. No flooding was predicted to occur for the 1 in 100-year return period event. Surcharging occurred for a number of critical storm events, but this is allowed and does not compromise or flood the network. The location of the critical storm events for each pipe run within the Micro-drainage Software model is indicated in Appendices B & C. The text specifying Flood Risk in the output data is indicated when the surcharging of the pipe run approaches within 300mm of the MH cover and this does not indicate flooding. The critical storm event for each catchment area is indicated in the output in the Appendices.

In relation to Attenuation it is proposed to increase the volume of the existing tanks

	Volume dedicated to Development (Enabling Works)	Revised Attenuation Required for Proposed Development	Additional Attenuation Required for Proposed Development
Tank 1	377 m^3	445 m^3	68 m^3
Tank 2	266 m^3	410 m^3	144 m^3

Table 5.1 – Summary of Additional Attenuation Volumes

In relation to the restricted outlets it is proposed to replace the existing

		Restricted Outlet Development (Proposed Works)	Restricted Outlet Road (Enabling Works)	Total (Proposed Works)
Catchment 1	Tank 1	5.66 l/s	3.69 l/s	9.35 l/s
Catchment 2	Tank 2	5.90 l/s	3.4 l/s	9.30 l/s

Table 5.2 – Summary of Revised Restricted Outlets

The foul water network model was built and analysed using the Micro-drainage Software application and was assessed to ensure velocities maintained a self-cleansing velocity.

The foul water network model was built and analysed using the Micro-drainage Software application and was assessed to ensure velocities maintained a self-cleansing velocity. The system

will consist of an internal gravity network discharging to the existing Irish Water asset via a pumping station.

11 November 2022

Our Ref: CDS22007050 Pre-Connection Enquiry
Kilnap, Old Whitechurch Road, Cork

Dear Stephen,

We have completed the review of the Pre-Connection Enquiry.

Irish Water has reviewed the pre-connection enquiry in relation to a Water & Wastewater connection for a Housing Development of 472 unit(s) at Kilnap, Old Whitechurch Road, Cork, (the **Development)**.

Based upon the details provided we can advise the following regarding connecting to the networks;

- **Water Connection** - Feasible without infrastructure upgrade by Irish Water
- **Wastewater Connection** - Feasible without infrastructure upgrade by Irish Water

This letter does not constitute an offer, in whole or in part, to provide a connection to any Irish Water infrastructure. Before the Development can be connected to our network(s) you must submit a connection application and be granted and sign a connection agreement with Irish Water.

As the network capacity changes constantly, this review is only valid at the time of its completion. As soon as planning permission has been granted for the Development, a completed connection application should be submitted. The connection application is available at www.water.ie/connections/get-connected/

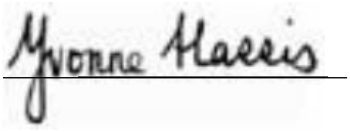
Where can you find more information?

- **Section A -** What is important to know?

This letter is issued to provide information about the current feasibility of the proposed connection(s) to Irish Water's network(s). This is not a connection offer and capacity in Irish Water's network(s) may only be secured by entering into a connection agreement with Irish Water.

For any further information, visit **www.water.ie/connections, email newconnections@water.ie** or contact 1800 278 278**.**

Yours sincerely,



Yvonne Harris
Head of Customer Operations

Section A - What is important to know?

What is important to know?	Why is this important?
Do you need a contract to connect?	• Yes, a contract is required to connect. This letter does not constitute a contract or an offer in whole or in part to provide a connection to Irish Water's network(s). • Before the Development can connect to Irish Water's network(s), you must submit a connection application and be granted and sign a connection agreement with Irish Water.
When should I submit a Connection Application?	• A connection application should only be submitted after planning permission has been granted.
Where can I find information on connection charges?	• Irish Water connection charges can be found at: https://www.water.ie/connections/information/charges/
Who will carry out the connection work?	• All works to Irish Water's network(s), including works in the public space, must be carried out by Irish Water*. *Where a Developer has been granted specific permission and has been issued a connection offer for Self-Lay in the Public Road/Area, they may complete the relevant connection works
Fire flow Requirements	• The Confirmation of Feasibility does not extend to fire flow requirements for the Development. Fire flow requirements are a matter for the Developer to determine. • **What to do?** - Contact the relevant Local Fire Authority
Plan for disposal of storm water	• The Confirmation of Feasibility does not extend to the management or disposal of storm water or ground waters. • **What to do?** - Contact the relevant Local Authority to discuss the management or disposal of proposed storm water or ground water discharges.
Where do I find details of Irish Water's network(s)?	• Requests for maps showing Irish Water's network(s) can be submitted to: datarequests@water.ie

What are the design requirements for the connection(s)?	• The design and construction of the Water & Wastewater pipes and related infrastructure to be installed in this Development shall comply with ***the Irish Water Connections and Developer Services Standard Details and Codes of Practice,*** available at www.water.ie/connections
Trade Effluent Licensing	• Any person discharging trade effluent** to a sewer, must have a Trade Effluent Licence issued pursuant to section 16 of the Local Government (Water Pollution) Act, 1977 (as amended). • More information and an application form for a Trade Effluent License can be found at the following link: https://www.water.ie/business/trade-effluent/about/ **trade effluent is defined in the Local Government (Water Pollution) Act, 1977 (as amended)

Kilnap Bridge

Northern Attenuation Tank 2
- Storage volume = 320.4m³
- Invert level = 42.035mAOD
- Depth of storage = 1.075m
- Flow control limited to 20.1l/s (3.4l/s for road + 16.7l/s for attenuated development flows at Q_{100})

Upgrades
Existing Tank volume to be increased by 144m³ and the restricted outlet replaced with an outflow of 9.30 L/s

Existing hydrocarbon fuel/oil separator (Klargester nsbe015 o.s.a.)

Additional storage added to existing tank shown dotted (27m X 6m x 1m = 162m³)

Additional storage added to existing tank shown dotted (27m X 6m x 1m = 162m³)

Manhole smh33 fitted with New Stormbrake flow control device limiting outflow to 9.3l/s

Manhole SMH20 fitted with New Stormbrake flow control device limiting outflow to 9.35l/s

Northern Attenuation Tank 1
- Storage volume = 431.3m³
- Invert level = 48.200maod
- Depth of storage = 2.15m
- Flow control limited to 29.89l/s (3.69l/s for road + 26.2l/s for attenuated development flows at q_{100})

Upgrades
Existing Tank volume to be increased by 68m³ and the restricted outlet replaced with an outflow of 9.35 L/s

Existing Hydrocarbon fuel/oil separator (Klargester nsbe015 o.s.a.)

Stormwater Attenuation System
Installation Acceptance / Completion Certificate

Project Name: OLD WHITECHURCH Rd **Customer:** WARP + BURKE

Project Number: Tank2 **Date:** 09/09/20

Location: CORK **Partial:** ..... **Final:** /

The Purpose of this acceptance/completion certificate is to accurately define the scope of work which has been completed by Geoline Ltd. in accordance with the project plans and specifications. Completing this scope of work allows Geoline Ltd. to transfer title to the contractor/owner, thereby allowing additional work to proceed or use by the owner as appropriate. It is acknowledged by Geoline Ltd. that certain additional documentation may be submitted after demobilisation.

1 Introduction

This report details a proposal for the installation of a foul water pump sump for a proposed housing development in Whitechurch Rd, Co. Cork. This pump sump is designed as per part 5 of the Irish Water Code of Practice for wastewater infrastructure.

2 Design Criteria

The design conditions are as follows:

Hydraulic load:	96 housing units @ 446litres/unit = 42,816 litres
Rising main length:	310m
Static head:	10.6m (inc. pump sump)
Total head:	14.2m
Flow rate:	5.77 l/s
Rising main:	110mm HDPE SDR17
Inlet pipe:	225mm
Inlet invert	3.380m below ground level

*Assumes 2.7 persons per house with a load of 150 l/person/day and a 10% allowance for infiltration

3 Hydraulic Calculation

Please see attached friction loss calculation sheet and pump datasheet for pump details. The velocities were maintained between 0.75 and 1.8m/s within the rising main.

The levels within the pump sump are set to pump approximately 920 litres per discharge (250mm between cut in and cut out levels with a surface area of 3.68m2). Assuming the daily hydraulic load is concentrated over a 10-hour period the hourly flow rate would be 4,282 litres per hour. This would equate to approximately 5 starts per hour. This pump will run for approx. 2.65 minute per discharge (920 litres/cycle/ 5.77l/s = 159 seconds; or 2.65 minute).

4 Proposed Tankage

This proposal consists of approximately 45,200 litres of emergency storage (>24hr capacity), which is made up of the available capacity in the holding tank and pump sump and isolation chamber. The entire emergency storage is created between the pump's cut in level and the inlet invert level. In general, day-to-day operation influent enters the pump sump and is pumped via the rising main into the receiving sewer line. Flow is prevented from entering the holding tank by a flap valve. In the event of power or equipment failure the pump sump overflows into the holding tank. When the system returns to normal operation flow moves from the holding tank into the pump sump via the flap valve by gravity. A summary of the tankage is as follows:

- 1 no. isolation chamber
- 1 no. precast concrete pump sump
- 1 no. holding tank
- 1 no. precast concrete valve chamber
- 1 no. precast concrete meter chamber

4.1 Buoyancy check

The below buoyancy check includes for a water table at ground level and empty tanks. Density of materials are as follows:

Material	Density (kN/m^3)	Legend
Concrete	24	D_c
Stone	20	D_{st}
Soil	18	D_s
Water	10	D_w

PUMP SUMP

Component		Total Volume (m^3)		Weight (kg)	Provided Force (kN)
Tank		39.32		23,510.4	230.637
Risers		1.21		1,231	12.08
Overburden (stone)		1.47		2,940	28.84
Total	V_p	42.00		27,681	271.55
Minimum required force to prevent floatation (FOS of	F_r=	494.45	kN	$F_r=V_pX1.2X9.81$	
Difference between req. and provided force	F_d=	222.89	kN	$F_d=F_r-F_p$	
Required volume of concrete to prevent flotation	C_v=	15.92	m^3	$C_v=(F_d/(D_c-D_w)$	
Comments	16m^3 of concrete should be placed evenly around the toe of the tank.				

HOLDING TANK

Component		Total Volume (m^3)		Weight (kg)	Provided Force (kN)
Tank		48.69		27,400	268.79
Risers		4.25		3,423	33.58
Overburden (stone)		36.57		73,141	717.51
Total	V_p	89.51275		103,964	1019.89
Minimum required force to prevent floatation (FOS of	F_r=	1053.74	kN	$F_r=V_pX1.2X9.81$	
Difference between req. and provided force	F_d=	33.85	kN	$F_d=F_r-F_p$	
Required volume of concrete to prevent flotation	C_v=	2.42	m^3	$C_v=(F_d/(D_c-D_w)$	
Comments	4.5m3 of concrete should be placed equally about the joint and top of the tank.				

VALVE CHAMBER

Component		Total Volume (m^3)		Weight (kg)	Provided Force (kN)
Tank		7.30		7,709	75.63
Risers		0.29		344	3.37
Overburden (stone)		1.04		2,497	24.50
Total	V_p	8.623		10,550	103.50
Minimum required force to prevent floatation (FOS of	F_r=	101.51	kN	$F_r=V_pX1.2X9.81$	
Difference between req. and provided force	F_d=	-1.99	kN	$F_d=F_r-F_p$	
Required volume of concrete to prevent flotation	C_v=	-0.14	m^3	$C_v=(F_d/(D_c-D_w)$	
Comments	Sufficient force is available to counteract uplift, therefore no anti-flotation measures are required.				

METER CHAMBER

Component		Total Volume (m^3)		Weight (kg)	Provided Force (kN)
Tank		3.41		3,410	33.45
Risers		0.12		190	1.86
Overburden (stone)		0.58		1,395	13.68
Total	V_p	4.11		4,995	49.00
Minimum required force to prevent floatation (FOS of	F_r=	48.38	kN	$F_r=V_pX1.2X9.81$	
Difference between req. and provided force	F_d=	-0.62	kN	$F_d=F_r-F_p$	
Required volume of concrete to prevent flotation	C_v=	-0.04	m^3	$C_v=(F_d/(D_c-D_w)$	
Comments	Sufficient force is available to counteract uplift, therefore no anti-flotation measures are required.				

ISOLATION CHAMBER

Component		Total Volume (m^3)		Weight (kg)	Provided Force (kN)
Tank		2.32		3,846	37.73
Risers		4.61		3,681	36.11
Total	V_p	6.9286		7,527	73.84
Minimum required force to prevent floatation (FOS of	F_r=	81.56	kN	$F_r=V_pX1.2X9.81$	
Difference between req. and provided force	F_d=	7.73	kN	$F_d=F_r-F_p$	
Required volume of concrete to prevent flotation	C_v=	0.55	m^3	$C_v=(F_d/(D_c-D_w)$	
Comments	$0.55m^3$ of concrete should be placed evenly around the toe of the tank.				

4.2 Isolation Chamber

This isolation chamber houses a penstock valve connected to the inlet.

- The precast concrete unit shall conform to BS 5911-4 and IS EN 1917. Joints shall provide equivalent water resistance as required in IS EN1992 – Part 3 (2006). The tank joints should be surrounded with not less than 150mm thickness of C20/25 to IS EN 206, 20mm aggregate size to IS EN 12620

4.3 Pump Sump

The pump sump should follow the following specifications:

- Precast concrete 6m deep 2.4m diameter pump sump
- Precast concrete 45-degree benching
- The precast concrete unit shall conform to BS 5911-4 and IS EN 1917. The tank should be backfilled with 500mm width of Clause 808 material, compacted in 300mm layers.
- For odour control should be installed as per STD-WW-34 (to be supplied and installed by others)
- The proposed pumps are 2 no. 4 pole Flygt NP 3102 foul submersible pumps (or similar)
- Pumps to be equipped with an automatic decoupling arrangement complete with twin stainless steel guide rails, easy lift, etc
- Automatic selection rotation of the duty/standby to be provided on an hours run basis with manual over-ride
- Pumps to be ex rated in accordance to hazardous area classification for foul wastewater
- Pumps to be operated as duty/standby
- The proposed pumps have an 80mm discharge connection
- The design should limit the number of starts to 10 per hour
- Pumps to be labelled at the top of pump sump and in kiosk
- Pumps to be equipped with certified stainless-steel lifting chain (IS EN 818-Part 7 (2009), suitably sized, with large links at 1m centres
- DN100/DN80 EN598 ductile iron pipework within the wet well to be bracketed using stainless steel brackets
- Motors to include stator over temperature protection which automatically re-set when temperature returns to normal
- High level float switch
- An ultrasonic level sensor is used to communicate adjustable set points for pump unit cut in and cut out as well as top level liquid level cut in and low-level over-ride cut out to the control panel (Pulsar Ultra Lite with snore function)

4.4 Emergency Overflow and Storage

A separate precast concrete emergency overflow tank (holding tank) is required to create 24 hours emergency storage. This together with the storage above the cut in level is used to create this storage.

- 1 no. 38m3 precast concrete tank
- The precast concrete unit shall conform to BS 5911-4 and IS EN 1917. Joints shall provide equivalent water resistance as required in IS EN1992 – Part 3 (2006). The tank should be backfilled with 500mm width of Clause 808 material, compacted in 300mm layers.
- A 250mm dia. high level overflow is to be provided

- A 250mm dia. return pipe feeding back to the pump sump fitted with a proprietary flap valve within the wet well chamber

4.5 Valve Chamber

A separate valve chamber is required and should have the following specifications:

- The precast concrete unit shall conform to BS 5911-4 and IS EN 1917. The tank should be backfilled with 500mm width of Clause 808 material, compacted in 300mm layers. Ductile iron pipework complete with bends, valves, fittings, etc. to link all fittings
- A gate valve for each pump mounted horizontally
- A non-return valve for each pump mounted horizontally
- A gate valve mounted vertically equipped with a Bauer coupling linked to the rising main for pumping out of the rising main
- The chamber should be equipped with a drain to allow draining of the chamber into the pump sump

4.6 Meter Chamber

A separate meter chamber is required and should have the following specifications:

- The precast concrete unit shall conform to BS 5911-4 and IS EN 1917. The tank should be backfilled with 500mm width of Clause 808 material, compacted in 300mm layers.1 no. magnetic flow meter (DN80 Siemens Mag 5100)
- Ductile iron pipework complete with fittings, etc. to link valve chamber to rising main

4.7 Control Kiosk

Control kiosk measuring 2.2m wide by 1.2m deep by 2m high shall be installed. This kiosk will have multiple locks to LPS 1175, SR3 or IS EN16257. An isolation station shall be provided within 2m of the pump sump to house connections. A small, galvanised steel kiosk shall be installed next to the control kiosk to house a 15m hose reel.

4.8 Control Panel

The following will be provided on the main control panel and within the control kiosk.

Control panel to be constructed to Form 2 in line with WIMES Electrical Specification and incorporate the following:

• Separate distribution board for an electrical heater, light, 220v and 110v waterproof socket	• Trip Indicator
• Soft Start operation	• Control Relays

• Duty standby assist operation	• Terminal Block
• 16amp 220v socket – sockets to be wall mounted	• Ammeters
• MCCBs with door interlocks	• Hour run meters
• Contactor	• Generator change-over switch
• Ventilation Fan, Filter and Stat	• Ultrasonic
• Hand/Off/Auto Selector Switch	• Flow meter
• Start Switch	• Dial out GSM for – high water, pump trip, power loss
• Stop Button	• Separate to the GSM please include for terminals for the above alarms (for future connection to a telemetry system)
• Run Indicator	• Adequate 3 phase power supply to be provided by others

5 Access

C250 galvanised steel lift assist covers will be provided for the following components:

Pump sump: 1 no. 1,400 X 800mm clear opening

Valve chamber: 1 no. 1,400 X 800mm clear opening

All covers should be as follows:

- lockable, fabricated from steel, galvanised to IS EN 1461 (2009) with non-slip surface and finished flush with roof slab of chamber
- Hinged with recessed padlock
- Each leaf to have assistance to ensure a lifting effort of 25kg
- Double, hinged access covers to be provided with inert gas charged or hydraulic operated springs suitable for solo lift

The meter chamber & holding tank is to be equipped with D400 800mm by 700mm ductile iron hinged cover.

6 System Guarantee

Molloy Environmental Systems provides a 2-year warranty to remedy any fault in products provided:

- That the fault is due to defects in design, materials or workmanship
- That the fault is reported to Molloy Environmental Systems during the guarantee period
- That the product has been used only under the conditions described in the care and maintenance instructions, and in applications for which it is intended
- That all service and repair is carried out by Molloy environmental personnel as per the maintenance requirements
- Therefore, this warrantee does not apply to faults resulting from lack of maintenance, inadequate civil works, repair works carried out improperly or normal wear and tear
- Furthermore, Molloy Environmental Systems disclaims any liability in case of physical injuries, material or economic damages for those mentioned above.

7 Maintenance Requirements

Operator's Inspection and maintenance duties

It is the responsibility of the owner to:

- Ensure the pump sump is operated and maintained in proper order
- Familiarise himself/herself with this operation and maintenance manual
- Familiarise himself/herself with operation safety instructions
- Ensure the system is serviced
- Ensure any faults are dealt with in a timely manner

The operation of the pump sump is the owner's responsibility. The general duties would involve.

Daily

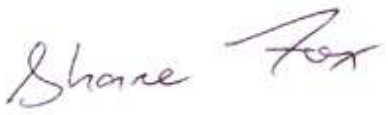
- General visual check to see if alarm beacon is flashing

Annually

- Arrange for tests and a full service of pump and control equipment by Molloy Environmental System

Please contact me if you require any additional information.

Yours sincerely,



Shane Fox BEng PhD MIEI
Environmental Process Engineer

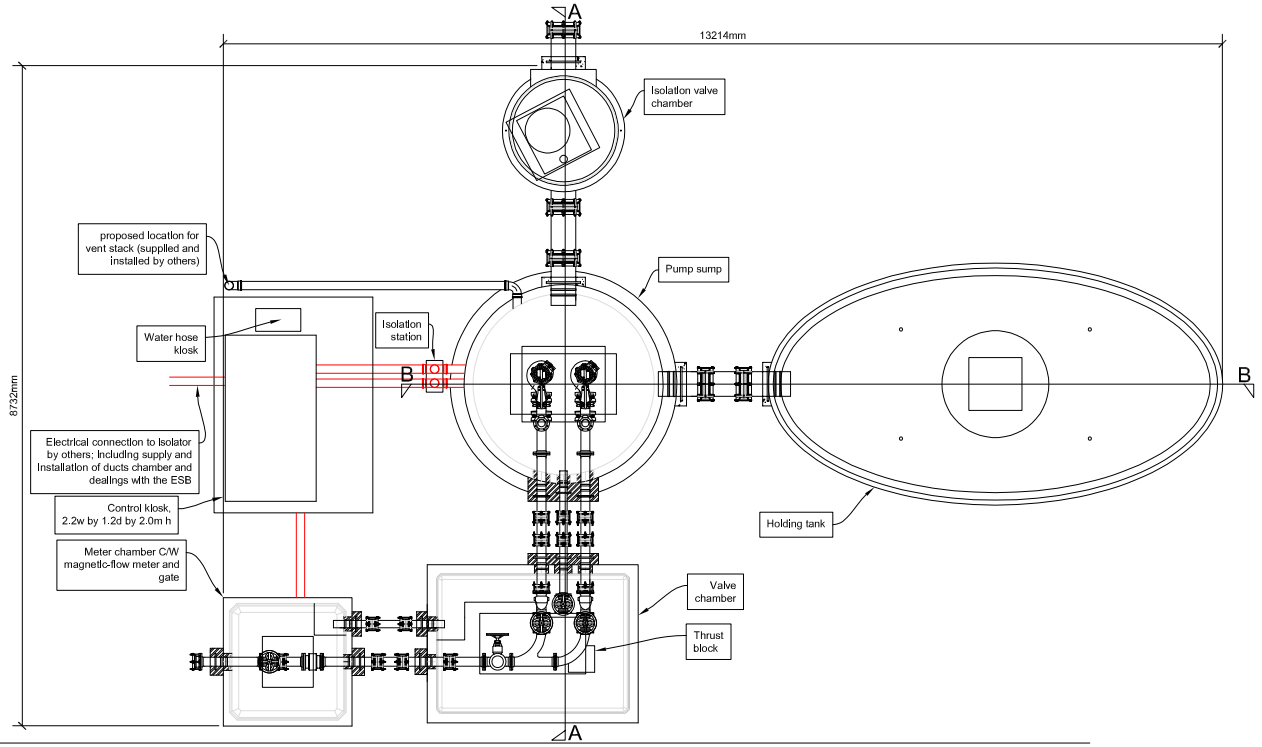
SECTION through A-A

SECTION through B-B



PLAN

Tank lifting limitations:
Max chain angle < 60°

< 60° ✓ > 60° ✗

Damage caused by incorrect lifting is the responsibility of others

Notes:

- Backfill around each precast concrete component shall be placed so that a 500mm width of Clause 808 material, compacted in 300mm layers is provided to ensure adequate support beneath any structures or structural surrounds.
- Free draining granular material, 500mm wide, shall be provided round the wet well close to ground level of the unit
- Observe all safety regulations in regard to excavation and lifting requirements. Never leave opening uncovered or unattended at any time
- Specify any specific requirements prior to ordering. All civil works by customer
- Do not scale from this drawing. Only for illustration purposes
